Melting Giants

Because of a chance overheard conversation, I found myself on the coast of Newfoundland looking for icebergs. I didn't know what I would find, but what I saw saddened me.

These giants live a very short life.

Birthered in Greenland, they spend 9-12 months wandering the seas until they come along the coast of Newfoundland. There they break into smaller pieces, run aground and rock in the surf until they melt on the shore as 30,000 year old ice cubes.

Such a sad story.
